

Objective: This phase is designed to assess your technical expertise and how you apply it to solve real-world customer problems. Your task is to analyze a given scenario and showcase your solution to a group of customer stakeholders.

Assignment: You are a **Cohere Solution Architect** that is continuing a previous discussion with a customer. Examine the provided customer scenarios and prepare a presentation that demonstrates your Cohere based solution. Your presentation should clearly outline the problem, explain your proposed solution, and walk through the technical architecture you are proposing. You should be prepared to answer questions and show how your solution addresses the problem. Remember, some ambiguity is expected in the scenario. Feel free to make and highlight necessary assumptions for your solution.

Presentation Guidelines:

- Plan to allocate approximately **20-25 minutes** for the presentation and discussion, using the remaining time for an open Q&A session.
- The Presentation Interview will be in a role-play format, with the interview panel assuming roles from the customer side. The interview panel will ask questions throughout the presentation. Be prepared for an interactive session with technical and business questions from multiple stakeholders.
- A live demo of the solution followed by a walk through of the technical implementation details is required. Feel free to use a jupyter notebook, streamlit, or any similar tools you are comfortable with.
- We are more focused on how it works, not how good it looks. While you can leverage public notebooks as a starting point, please ensure to modify or add elements to make it unique and showcase your technical ability. Using Cohere models is highly encouraged.

Scenario: Each of these scenarios requires an LLM/NLP-Focused solution that is scalable, secure, and tailored to the specific needs and challenges of the industry. Choose one that best allows you to showcase your solutioning and technical acumen.

Ecommerce: A leading e-commerce firm, GlobalMart has experienced a significant decline in sales that has coincided with a competitor's introduction of an intelligent personal shopper feature. Data analysis indicates that customers are leaving

GlobalMart's website early and spending less time shopping, possibly due to less personalized and relevant product search results. The business team seeks a scalable solution that efficiently utilizes customer data and reviews to provide highly pertinent search results, with a critical emphasis on keeping their data secure and off the public internet.

Healthcare Integration: Cohere is approached by HealthFirst, a large hospital network looking to improve patient care through technology. They want to integrate AI-driven diagnostic tools that can analyze patient data, external information, doctors notes, and other unstructured data to assist doctors in making faster, more accurate diagnoses. The challenge is to ensure the solution is compliant with healthcare regulations, integrates seamlessly with their existing systems, and maintains patient confidentiality.

Financial Services Compliance: FinTrust, a leading bank, is concerned about regulatory compliance in its lending practices. They need an AI solution that can analyze loan applications, assess risk, and ensure compliance with various international financial regulations. The current system has trouble processing the text data within loan applications. The system must be scalable, transparent, and able to adapt to changing regulations.

Educational Personalization: EduTech, an online education platform, wants to personalize learning for its users. They need a system that can analyze student performance, learning styles, and preferences to tailor the content, pace, and teaching methods for each learner. The challenge is to build a scalable, secure solution that respects privacy and can adapt to different educational curricula and standards.

If you are interviewing for a Public Sector opportunity on our Solutions Architect team you may also choose this scenario:

Defence Agent: DefTech, a national defence technology agency that wants an AI assistant to help their staff interrogate manuals, procedures and doctrine. They have previously relied on internal users reading PDFs, physical manuals and textbooks. They have recently gone through a digital transformation where all manuals and procedures are contained within PDFs and Docx files in a central database. The feedback from their Chief of Staff is that they need to leverage AI over their new database to increase the efficiency and output of central planning staff while accuracy and traceability are key.
